ARCHITECTURE - TP05

L2 Informatique

0.1. Produit scalaire

total size = line size \times nb lines in set \times nb sets

Figure 1: Illustration des différentes variables de l'énoncé

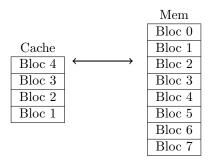

Table 1: Illustration du LRU

Lorsqu'on a une erreur (i.e. l'adresse de l'élément recherché est dans un bloc de la mémoire non chargé, par ex 0 ici), on charge le bloc contenant l'adresse. Mais pour cela on doit remplacer un bloc déjà présent ; la politique LRU convient que le bloc à remplacer est celui qu'on a utilisé il y a le plus longtemps.

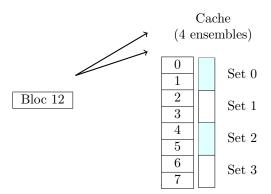

Table 2: Illustration de l'associativité (2-way)

On redivise le cache en $\alpha = \frac{\text{nb blocs cache}}{\text{nb d'associativit\'e}}$ ensembles.

Puis on calcule n° bloc mémoire mod α , ce qui nous donne l'ensemble auquel il appartient.

Enfin on choisi le bloc de l'ensemble à remplacer suivant la politique définit.

Dans notre cas, on a $\alpha = \frac{8}{2} = 4$ donc 4 ensembles, 12 mod 4 = 0 donc le bloc 12 va dans l'ensemble 0, et enfin on a une associativité de 2 donc a choisit entre les deux blocs de cache de l'ensemble 0 à remplacer suivant

la politique LRU.

0.1. PRODUIT SCALAIRE

 $N=64\ 2a$: pas échec conflit car pas de =! suivant le niveau d'associativité, pas de varia avec taille cache donc pas d'échecs à froid donc c'est que ds erreurs de capacité (prévisible car au plus chaque bloc fait à peine la taille de x, y ou s).

N=512~2b: pas d'échecs à froid car indé taille cache (qd taille > 4096, sinon erreurs associativité) sinon très large majorité échecs capacité mais aussi échec conflit présent pour cache = 4096 car petit cache donc associativité à + d'impact (+ associativité augment, moins y'a d'erreurs d'ailleurs).

N = 1000 2c:

N=1024~2d :

 $N = 2048 \ 2e$:
